35p

1-7 September 1983 Vol 2 No 35

## This Week

### Spectrum software

Simon Lane looks at another range of Spectrum software including *Tranz Am* from Ultimate and *Zip-Zap* from Imagine. See page 14.

### Space Invaders

David Kelly talks to Taitel, the company which first imported *Space Invaders* into the UK. See page 13.

### BBC geography

John Meech presents a simple geography quiz for the BBC model B on page 20.

### New releases

All the latest software games including *Pearl Harbour* from Sabresoft and *Dragon Cruncher* from Elkan Electronics. See page 45.

**★ STAR**  
Damsel in distress  
on Spectrum.  
See page 10.

## News Desk

### Electron launched ... at last

THE Electron microcomputer has at last been officially launched.

The new £199 machine, originally announced over 16 months ago, was delayed because of complications with the design of its giant ULA chip which, it is hoped, will deter hardware pirates from producing 'rotten' Electrons. Says Acorn's joint managing director Hermann Hauser: "It

is by far the largest custom chip anyone has put in a micro with over 2,400 gates — I defy anyone to copy that chip."

Acorn hopes to sell over 100,000 machines by February next year. At present, the Electron is being manufactured in Malaysia but, within the next six weeks, Acorn hopes to conclude agreements

Continued on page 5

### For whom the bell tolls

FOR the first time a UK court has granted an arcade machine manufacturer an injunction restraining a home computer software house from selling a program which it claims infringes its copyright.

Century Electronics, Europe's largest arcade originator, was granted an ex-parte injunction on August 13, against the Leeds-based software house Superior Software. Superior Software has been advertising a game called *Hunchback*, which Century claims is an infringement of the visual-image copyright in its *Hunchback* arcade game launched at the Amusement Trade Exhibition in January.

The decision taken in the high court last week had far-reaching implications. It is the first time that an English court has granted an injunction on the basis of cinematographic copyright in the visual image of an arcade game.

Up until this decision the only similar case was the US

## PROGRAMMABLE JOYSTICK INTERFACE

ONLY  
32.95  
+£100pp

### for Spectrum or ZX81

#### ABOUT OUR PROGRAMMABLE INTERFACE

Surpassing the outstanding specification of our Interface Module II which still offers the best software support at its price, a Joystick Interface that is compatible with ALL SOFTWARE through its unique hardware programmable design.

The Interface plugs on to the rear connector of your ZX81 or ZX Spectrum.

Quick clip-on connections, which are configured from a reference card supplied, allow you to define which of the forty keys are simulated by which action of the Joystick. A pack of ten Quick Reference Programming Cards makes setting for your favourite games even easier. These can be filled in to show at a glance the configuration required and stored in the cassette case of the particular game. When you change to a game using different keys the module is re-programmed in a few seconds.

As with our Interface Module II the Programmable Interface accepts all standard switch Joysticks that are Atari-compatible. Two sockets are available which are connected together for two player games which use the same keys for both players.

The Interface resides in the keyboard address space and does not affect its operation or interfere with any other add-ons. A rear extension edge connector will accommodate expansion of your system.

The unique AGF key simulation principle makes it extremely easy to incorporate Joystick action in your own programs. All eight directions and fire are read by simple BASIC.

With every order comes a free demonstration program called 'Video Graffiti' plus a full set of instructions.

#### KEY FEATURES

- Programmable design gives TOTAL software support.
- Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- Rear extension connector for all other add-ons.
- Free demo program and instructions.

#### PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE. This can be fixed on to the case of your computer or if preferred the protective backing can be left on. The chart is made of a very durable reverse printed plastic and is extremely easy to read.
- One pack of ten Quick Reference Programming Cards for at-a-glance setting in your games requirements. The card allows you to mark the configuration in an easy to read fashion with space to record the software title and company name.
- Video Graffiti demonstration program which is written totally in BASIC to illustrate how all eight directions and fire can be read. This is also a useful high resolution drawing program.
- 12 months guarantee and full written instructions.

## JOYSTICKS

### How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

### Accuracy

*Popular Computing Weekly* cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

## Editorial

The demise of Grundy Business Systems (*PCW* 25-31 August), manufacturer of the NewBrain micro, is an indication of the fierce competition faced by each of Britain's micro makers.

This Christmas may well be the last 'micro boom'. This is not to say that micro sales next year will suddenly plummet, rather that they are likely to flatten out. The sales curve, which seems to have been growing exponentially for the past three years, may finally reach a plateau.

Given a market which is no longer expanding at a phenomenal rate, the question of market share becomes increasingly important. Sinclair and Commodore are undoubtedly the big two as far as the home market is concerned. Acorn, as long as it retains its links with the BBC, should be assured of a share in the market.

Other manufacturers, however, from Atari and Texas Instruments to Dragon, Computers and Mattel, will be competing to grab as large a share of the market as possible. This could precipitate a further round of price cuts, whether or not the manufacturers can afford them.

The days when you could launch a micro of almost any description, stand back and wait for the money to flow in, are over. The fight is now on to see which companies will still be around in five years time.

## Next Thursday

Travel across deep space avoiding the asteroids and meteors, but collect as much cargo and fuel as possible. *Astro-Transporter*, next week's star game for the Vic20 by Benedict MacCarty.

TRADE ENQUIRIES WELCOME

## Electron challenges elder brother

Continued from page 1

to manufacture in the UK — possibly with AB Electronics in South Wales.

"It is our intention to dominate the £200 price range with the Electron," said Hermann, "in the same way as we have done in the £400 range with the BBC machine." He said that he expected the Electron price to remain at £199 throughout 1984.

Initial software support for the Electron consists of 12 titles converted from the BBC: *Creative Graphics*, *Graphs and Charts*, *Personal Money Management*, *Lisp*, *Forth*, *Starship Command*, *Monsters*, *Chess*, *Tree of Knowledge*, *Draughts and Reversi*, *Snapper* and *Meteors*.

The aim is to convert all of the existing BBC programs for the Electron. David Johnson-Davis, Acornsoft's managing director, expects it to be at least six months before the Electron software catches up with the BBC material.

A range of hardware add-on units is planned for the Electron — priced between £30 and £100.

## IBM Peanut to hit Adam

IT now seems likely that IBM will launch its down-market version of the IBM PC — the Peanut — in the US in late September or early October.

The machine is expected to cost around the \$800 and could cause some problems for the Coleco Adam, broadly in the same price band.

First shipments of the Adam computer, star of the Chicago CES Show, have been delayed. Originally scheduled for August 31, the first Adams are now planned for "early September". The delay is blamed on difficulties in gaining FCC approval in the US. Undaunted, Coleco still hope

The first of these will be a teletext adaptor, available before Christmas for around £100.

Next, at the start of 1984, comes a unit giving the Electron a Centronics printer interface, a joystick/paddle port and the ability to take Rom cartridges. The unit will have two sideways Rom ports, into which it will be possible to plug either Rom or Ram cartridges of up to 240K capacity in 16K steps, each piggy-backed off the next. The first Rom will be an enhanced version of *Snapper*, to appear in early 1984.

Following that comes the third interface unit giving the Electron discs and Econet.

Acorn is also to sell a home control system for the Electron to operate household electrical appliances. Like the unit recently announced for the Mattel Aquarius, it will be a development of the BSR system.

● Acorn took the opportunity of the Electron launch to give some indication of future products.

The Acorn Business Machine (ABM), a Z80-based CP/M machine with built-in display and discs, is planned for early 1984. A Computer Aided Design terminal is planned for 1985 and a communications terminal and a voice recognition and control system are also underway.

to ship 500,000 machines before Christmas.

It is now doubtful that any Adams will find their way to the UK in 1983.

## Commodore steams ahead

COMMODORE remains one of the few successful US computer manufacturers.

In complete contrast to Atari and Texas, both of whom have suffered enormous recent financial losses, Commodore has gone steaming ahead by announcing fourth-quarter and full-year earnings and sales up by a factor of two.

For the full-year, Commodore reported profits of \$91.7m. Sales for the year were up from \$304.5m to \$681.2m.

## Arcade injunction

Continued from page 1

one in which Atari won a legal battle with Philips' *Munchman* game which Atari claimed was a *Pac-man* rip-off. Atari were awarded the case on the basis of the audiovisual content of the game using the cinematographic protection laws.

"We have taken the action," said Century's managing director David Jones, "simply because we are protecting something that we have developed ourselves."

"There has been an awful lot of waffle about copyright not existing in computer games. What we are saying is — OK, there may be no rules but, each time somebody copies one of our games we will take them right down the road to the point where we get some rules."

"The days when a home computer software manufacturer can copy and ride on the back of an arcade success are numbered."

Richard Hanson, managing director of Superior Software confirmed that his company had been served with the Century injunction: "I got about 20 minutes notice that it was coming."

## Arcade/adventure twins

PHOENIX Software, the new company formed by Gerry Rose (see *Popular Computing Weekly*, August 18) has announced its game plan.

A range of twin-cassette titles will be sold, each consisting of an arcade game and an adventure game. In order to begin the adventure, it is necessary to master the arcade game — picking up clues and the vital loading code.

Six titles are presently under way — *Mission Moonbase*, *Dodge City* and *Mission Earth Centre* (all 48K Spectrum), *O' Level Caper* (Vic20) and *Airport Yesterday* and *Lunar Rescue* (Dragon 32).

Each twin-cassette pack will sell for £9.99.

## TI drops price

FROM September 1 the price of the TI99/4A computer in the UK will be chopped even lower, bringing the machine down to £99.95.

"We certainly do not admit in any extent that Century had a case. Whether we fight or not is another matter — the amount of money involved in litigation to fight it may well make it unfavourable for us to do so."

"We would be very happy if it became a general ruling that people could not make arcade game copies. But if we were to say that we were going to stop using arcade-type themes then I think that would put us in a disadvantageous position with regard to our home computer software competitors. To be competitive in the home computing field you have to produce arcade-type games — even if there is a possibility of some risk."

● Superior Software are not the only company to have been approached by Century. Mr Micro produces a game called *Hunchy*. Century has served Mr Micro with notice that it is to seek an injunction to stop sales of *Hunchy*.

Jim Gregory, managing director of Mr Micro has agreed to withdraw the title but vigorously denies that his game is an infringement of Century's copyright. "There is no question of passing-off. Our programmer Issi has seen the Century arcade game, but we have changed the graphics, the rules of the game and the scenario. The only tenuous link between the two games is that the plot for both is based on the same Victor Hugo novel and both feature a hunch-back person negotiating various obstacles. To fight the case would have cost us several thousand pounds. Very few companies can afford that kind of money — we simply couldn't afford to make our claims in court."

## End of a saga

Popular Computing Weekly has now received the two Microdrives and Interface. It is ordered on July 29.

Time taken to fulfill order: 28 days exactly.

# At last... A joystick that works!

Cambridge Computing bring you the first **programmable** joystick - at a price you can afford.

The  
**Intelligent**  
Joystick

**£29<sup>90</sup>**  
JOYSTICK, INTERFACE  
AND TAPE COMPLETE

## Interface

- 1k on board memory
- Own rear edge connector — for printers etc.,
- Compatible with all standard joysticks

## Joystick

- Self centring
- 8 Directional microswitched action
- 2 independent fire buttons

## Tape

- Easy to use program enables the interface to work on ALL software
- Keeps a record of all your games — so you only need to tell it about each game once!

**CAMBRIDGE  
COMPUTING**

Interface and Tape at £24.00

Joystick only at £7.00

For Spectrum

I enclose cheque / postal order\* for £.....  
made payable to Cambridge Computing Limited.

\*delete as necessary.

## Scrabble warning

This is a warning to families with young, or not so young, children, who have bought (or are considering buying) Psion's *Scrabble*.

We were playing it the other night, my wife, the Spectrum and me. It came to the Spectrum's turn: 'Spectrum thinking' it said — 'Fart' was the word on the screen. My wife and I fell about in hysterics.

I wonder what other words this program has in its vocabulary? May I congratulate Psion on the best program yet for the Spectrum.

Steve Freedman  
22 Larchwood Close  
Collier Row  
Romford  
Essex

With an 11,000-word vocabulary, I suppose it is not altogether surprising that Psion's *Scrabble* occasionally comes up with an interesting choice of word. If any other readers have been surprised by a *Scrabble* selection, please write in and tell us.

## Clear and sharp

Regarding Ian Beardsmore's advice on tuning the ZX81 (PCW 11-17 August), I have found a useful method of getting my ZX81 in tune.

When my computer's display becomes unclear, or when I switch it on, I simply use the *Save* command. Just enter *Save* "anything" *Newline* and wait till the black and white lines appear, leave them for a few seconds, then press *Break*. The display should now be clear and sharp.

Mark Letheren  
63 Effingham Road  
Long Ditton  
Surrey KT6 5LA

## Constant slating

I read with great disgust the constant slating that Sinclair Basic receives from readers of your, and many other, publications. To such critics I remind them that over 60 per cent of the micros on this

planet use this excellent dialect. By my definition "standard" means the most common and widely-used. Does this not make Sinclair's non-standard Basic in fact the standard?

P Crawley  
Bedstone College  
Bucknell  
Salop SY7 0BG

I fear that it is too late for any version of Basic to be adopted as the standard. The various micro manufacturers have too much tied up in their own systems to agree to accept someone else's version of Basic. Computer languages, as with their human counterparts, seem destined to remain both varied and incompatible.

## Significant omission

Correcting a tiny but significant omission from two of the demo routines given in the first of Peter Bartley's useful new series on Vic programming (PCW 18-24 August) will allow them both to Run correctly.

In the program tagged Figure 1, line 50 should read:  
50 PRINT MID\$(A\$,A,1)

Similarly, the first statement in line 40 of Figure 2 should read:

40 B\$=MID\$(A\$,A,1)

John Ransley  
12 Tamworth Road  
Hove  
East Sussex BN3 5FJ

## Instructive alternative

Owners of Vic20 machines may be interested in the following program lines. It was devised when entering Bryan Skinner's Database routine (PCW, 16-22 June) when I found that line 330 just would not work [no Instr facility on Vic20]. One alternative is to simply enter:

330 IF TAS = ARS(R,C,N) THEN GO SUB 440

However, as Bryan rightly states, this is a line that provides direct matching, and will not return "boat" from "boat-builder" etc. The following lines examine the string to look for, and then examine each array to determine whether the requested string forms any part of it.

330 GO SUB 2000

340 NEXT R  
2000 N = LEN(TAS)  
2010 M = LEN(ARS(R,C,N))  
2020 FOR P = 1 TO M  
2030 IF TAS = MID\$(ARS(R,C,N),P,N) THEN 2050  
2040 NEXT P: RETURN  
2050 TF = TF + 1: GO SUB 400: RETURN

Tip: This program takes up just under 2K. If you intend storing a lot of data then it is best either to write data to a tape file or use a memory expansion of 3K (at least).

John Hughes  
1 Wilson Road  
Alton  
Hants GU34 2SR

## Character transfer

Now that adventure games are available where a character's gained experience can be saved and reloaded for a replay, it is time for conventions to be established for reusing characters in different games.

Publishing the loading codes would allow the user's character to be transferred between different machines and enable programmers to write the relevant saving codes.

I would like to hear from anyone interested in this, whether they be programmers, software houses, distributors, magazine publishers or users.

Chris Whitehouse  
384 Queensbridge Road  
Dalston  
London E8 3AR

Well now, that is an interesting idea. It should certainly be possible for software houses to enable characters to be transferred from one game in a series to another, though it may be more difficult to transfer characters between different software houses. Anyone interested in pursuing this idea further should write to Chris at the above address.

## A question of scrolling

One of the problems with the Lynx is the lack of scrolling. This can be a disadvantage in a text-type program when you might want more than one message to appear on the screen at a time.

The following routine allows the last two or more messages to appear at the same time, depending on the number you

want and the size of each message.

First, dimension a small array (M) with the number of dimensions being the number of messages you want to appear at a time. The array is initialised with all elements at zero. All messages should be in a procedure and referenced by a number. The procedure is as follows:

```
5000 DEFPROC MESSAGE
5010 M(0) = M(1), M(1) = M(2), M(2) = M
5020 CLS
5030 GOSUB 5100 + M(0)*30
5040 GOSUB 5100 + M(1)*30
5050 GOSUB 5100 + M(2)*30
5060 ENDPROC
5100 PRINT
5110 PRINT
5120 RETURN
5130 PRINT
5140 PRINT "THIS IS MESSAGE NO 1"
5150 RETURN
5160 PRINT
5170 PRINT "THIS IS MESSAGE NO 2"
5180 RETURN
```

K Walker  
8 Shandon Terrace  
Hamilton  
Lanarkshire  
ML3 9UL

## Highest orbit

After playing Silversoft's excellent game *Orbiter* for 51 minutes, I scored 254,305 points and had reached wave 17. Is this a record?

After wave six, your ship returns to the planet's surface like wave two, but with more pods and green (unmutated) aliens.

Philip Crawley  
Bedstone College  
Bucknell  
Salop SY7 0BG

## Machine code series

In reply to M Barrett's letter (PCW 18-24 August) requesting a machine code series for the Spectrum, if he cares to send me £1 and an A4 stamped addressed envelope, I can send a copy of the PCW series which is first-rate.

PS. How about some Spectrum star games which make the central figure more than one character high?

# Damsel In Distress

A new game for 16K Spectrum by Richard Bartlett

In this program you play the role of a brave knight. And you must rescue the poor "damsel in distress" who is locked up in a large castle. Be careful though, because not every fairy tale has a happy ending and whether this one has is up to you because there is an evil knight who is

in hot pursuit. Full instructions are included in the program.

## Program notes

30-40 Assign variables and calls on subroutines for instructions and user graphics  
60-61 Level of difficulty  
70-170 Set up screen display  
210-590 Main loop

# Running the gamut

David Kelly talks to Taitel, the people who brought you Space Invaders

**S**pace Invaders — an entire sub-culture unto itself! And the game which lent its name to collectively describe the whole gamut of video games.

Taito originated the game in Japan. Taito (UK), now called Taitel, imported the coin-operated machines.

Says Taitel's managing director David Coren: "In the UK everything that has happened — the whole video games industry — has sprung from us."

Arcade video games began before even the microchip was invented. Early games like *Pong* and *Breakout* were built using conventional transistor — transistor logic.

With the advent of the microprocessor, the industry took off. *Space Invaders* was followed by a host of imitators. More advanced processors brought with them colour, sound and sprite handling. Two years ago saw the first multi-processor game board using Z80s.

A typical circuit board now may have separate processors for each function of the game — master control console, sound, graphics.

Says Taitel's technical director, Jonathan Lister: "We see most of the new technology types at least six or eight months before the computing industry, because all the major manufacturers work so closely with the chip designers. In turn the designs use our industry as a test-bed. We've had the 68000 and the 16-bit Z80 equivalent, the Z8000, for five or six months now and we are just getting involved with the 27128 128K Eproms."

As the arcade machines have increased in complexity, so they have lost flexibility. Each piece of hardware and software is very much dedicated to implementing a particular games idea. According to Jonathan, very few machines are now capable of being adapted to run more than one game.

One reason for the increased complexity of the circuit boards — apart from the quest for better games — is illegal copying of complete game boards. These days manufacturers spend a great deal of money and effort building in security.

To say that Taitel is an arcade game manufacturer is perhaps a little misleading. The industry makes the distinction between originators and manufacturers.

**C**ompanies like Sega, Taito, Gottlieb and Kjonami are originators — producing the game boards with the software in Eprom. Taitel then assembles the machines, builds the cabinets, power supplies, buys the monitors and the coin-handling equipment. Taitel assembles about 120 machines a week. *Star Jockey* a batch of machines just being finished, has its games software built into 15 128K Eproms.

This scale of Rom capacity is needed

because, for an arcade game to be competitive now it must feature both moving foregrounds and backgrounds. *Zaxxon* is a good example — "That game has an awful lot of screen information to handle — and at a much higher speed than a home computer game," says Jonathan.

Almost all video games origination takes place in either the US or Japan. "Either one side of us or the other," David grins, "whichever side — it's a long way away!"

Assembled boards are brought in for between £300 and £500 and sold to the trade as completed machines for around £1,200.

**B**y splitting off from Taito two years ago, Taitel freed itself to build and distribute games of its choice from the whole range of originators.

"It put us in a very strong position to pick and choose the best games," says Jonathan. David agrees: "In today's market-place it's essential not to be tied to one particular originator."

Almost two years ago the coin-op video industry hit rock-bottom. The *Space Invaders* boom — which had lasted for two years — tailed off and there was nothing to replace it. The recession hit and there was a lack of good games.

The industry is now climbing out of its trough and the expectations of the industry have reached more normal proportions. "It is generally recognised that we will never again take the same money for such long periods as *Space Invaders* did."

Genuine operators and manufacturers now realise that the video gaming industry is here to stay and that it requires a steady investment in technology to develop a succession of successful games, explains Jonathan.

"The whole period of *Space Invaders*

was grossly over-exaggerated by the media and the sort of income figures quoted in newspapers at the time were the exception rather than the average."

The video game world has now settled down quite considerably — and has become a fashion industry. There are video game hits — and the top games change every couple of months.

David: "A top-class game will last for a year or so. *Buck Rogers* from Sega is still taking good money after that length of time. *Frogger* is two years old."

Taitel spends "thousands of pounds every month on protecting the rights of the originators for which it has an exclusive licence. "We will protect a game for

whatever life is," says David. "We would still protect *Space Invaders* for Taito, five years on."

*Pole Position* is another long-lasting game from Atari. "There still isn't a better driving game — a year after it was launched. There will be, though, in 1984."

This remark is a reference to a fundamental change taking place in the arcade video game world — computer-video disc combination machines.

Sega has spent a reported \$1.5m on developing the first laser disc arcade game, mixing computer graphics and video pictures from disc. Called *Astron Belt*, the machines are much sought-after and command a high price — about four times the cost of a conventional video games machine — around £4,700.

Other manufacturers have not been slow in following Sega's lead. Taito and Cinematronics both have machines on the way. Taito's — which Taitel plan to handle in the UK and which will be shown in September — is remarkable.

It is the race game which David Coren referred to. Called *Laser Grand Prix*, the game mixes an extremely realistic computer-generated field of racing cars with real video footage from a car's point-of-view, of the Japanese Fuji racing circuit.

"The game takes realism to a new level — what it will do to the arcade industry, I don't know," says David.

"The new generation of games have one big advantage. Where, in the past, home computer games tended to follow on the heels of the arcade industry — getting closer and closer to the "arcade" standard — if laser-disc takes off, they will have a job following from here on in."

"The new type of arcade piece will have a significant edge. *Astron Belt* is a space

Jonathan Lister (left) and David Coren

game and everybody has their own particular impressions about what future space travel may be. *Laser Grand Prix* is much more down to earth. Everybody has some perception of what it would be like to drive round a race track.

"I would doubt that the depth of game given by *Laser Grand Prix* will be matched on a home computer for some considerable time."

And where next? David and Jonathan both foresee the possibility of an interactive game, like *Laser Grand Prix*, being played by players on separate machines linked together. Competing against the player on the next machine, rather than the computer.

## The sound of beating arms

**Software author Simon Lane turns reviewer and finds that the latest Spectrum games vary considerably in quality**

Sinclair Spectrums still seem to be selling like hot cakes, despite the ever increasing number of micros competing for a share of the home computer market. The price reductions and the recent arrival of the long awaited Microdrives make the Spectrum as good a buy as it was on its launch 16 months ago. But, perhaps the main reason why people still opt for the machine is the amount of software available for it.

The older software companies are still pouring out software at an alarming rate, while new companies are being formed all the time. But, the competition is stiff and, however much is spent on promotion and public relations, the companies which will survive will ultimately be determined by the quality of the programs each one sells.

*Spectrum Missile Defence* comes from Anirog Software and is a version of that old arcade favourite, *Missile Command*. For those few, if any, who are not familiar with the game, the scenario is as follows: Your City is being attacked by ICBMs (Inter Continental Ballistic Missiles) from an unnamed Communist Superpower. Fortunately, you have a rather powerful laser

on copyright, this may not have been such a good idea.

The only noticeable difference between the two is that in this version the six cities have been replaced by trucks, planes and various other pieces of equipment. Personally, I think that this is an improvement as it adds some variety to the game.

The only fault that I can find with the game is that it is very difficult to get used to the keys. 1, 2 and 3 are used to fire missiles from the corresponding missile bases, while 5, 6, 7 and 8 (cursor keys) are used to position the sight. This arrangement tends to lead to difficulties, since you are forced to control the movement of the sight with one hand and, consequently, you tend to spend most of the time going up when you want to go down, and vice-versa.

### A robotic gardener

Diagonal movement is reserved for the superbly co-ordinated, since it requires the simultaneous depression of the relevant horizontal and vertical

controls. However, the program is compatible with the Kempston joystick which makes life considerably easier. I assume that the use of the joystick sacrifices the ability to fire the missile bases independently of each other (the review copy did not have the joystick option).

Besides the relatively minor inconvenience of the keys, the game is excellent and is far better than the versions of the game available for

artwork, but this time depicting a turbo-charged racer instead of a space man or a robotic gardener. The controls are very simple to use, as there are only clockwise, anticlockwise, brake, accelerate and pause. The program can also be used with a Kempston joystick interface.

During the game the screen displays a very comprehensive collection of data. At the top left hand side of the screen are two figures, which represent the amount of time you have taken so far and the total number of miles travelled. Below this is a map of the United States, which shows refuelling points and your current position. Then there is another map, which covers a smaller area and which shows the positions of any enemy Black Turbos and cups in the area. Next to this is a figure for the number of cups you have collected so far.

At the bottom left hand corner of the screen are your speedometer, fuel gauge, temperature gauge and a display of the number of lives you have left. The whole of the right-hand side of the screen is taken up with a display of the area immediately surrounding your racer. This shows obstacles such as signs, boulders and cacti, as well as cups and fuel, and the deadly Black Turbos, of course.

The object of the game is quite simple — you must collect all eight cups, without being killed. However, this is made more difficult by the fact that you have to collect fuel at regular intervals in order to keep going. Also a number of other cars are out to get you by crashing into you, and some of them can go faster than you.

If you go too fast for too long, your engine over-heats and you have to slow down for a while to cool off.

The graphics, sound and presentation of the game are all of a very high quality. My only criticisms are that it is very difficult to concentrate on all the different pieces of information at once, and there is not enough of a reward for collecting all of the cups — on the one occasion that I did manage to pick up the eight cups, all I got for my efforts was a brief congratulatory message on the screen and the chance to go around again. All in all though, a very well written and addictive game.

*Zip-Zap*, from Imagine, is another game set in the future. In this game you are the only surviving member of Robot Prelim Team 0484, a group of worker and guard Droids sent on a reconnaissance visit to a previously unexplored planet.

However, just as the finishing touches are being applied to the teleportal system, the aliens inhabiting the planet attack with force. All the other Droids have been killed (if that's the right word) and your circuits are damaged. You are unable to turn off your motors. Your one objective is to survive for long enough to warn the approaching colonists, who are about to try and land on the aliens' planet.

The game is very difficult to play indeed. It is a bit like playing a game of *Asteroids* in which you cannot stop your spaceship

cannon to hand, with which you can (with enough skill and dexterity) intercept the missiles and destroy them before they reach their targets (at the bottom of the screen).

As in most 'zap' games, the aggressors come in waves, and with each new level the game becomes more difficult to play. *Spectrum Missile Command* is a very faithful copy of the original, having three independently controllable missile bases, attacking planes (corresponding to the good old saucers of *Space Invaders*) and a bonus at the end of each level — in fact, just about everything that was in the original version. Considering Atari's view

other home computers (including the Atari).

*Tranz Am* from Ultimate Play the Game has a far more original game design. The inside of the cassette insert starts off like this:

"The year is 3472 and that remains on Earth are the remnants of a once great continent, a barren land, a desolate place of sand, rocks and boulders. But... Life adapts quickly and brings with it a New Age, a time ruled by cars and trophies, a land where petrol replaces gold and esteem is possession of the 8 Great Cups of Ultimate."

As with all the Ultimate games, the tape starts with an impressive piece of graphic

from moving. When things start to get too difficult, you have to escape from the level you are on by collecting four fuel cells and teleporting to the next level.

The main criticism that I have of the game is that, although it is addictive, it is so difficult and consequently frustrating to play, that I find that I am unable to play it for more than a few minutes at a time. However, this may be something that is unique to me. Certainly, it is a very impressive game in most respects.

**Kamikaze** from A & F Software is based roughly on the arcade game *Galaxians*. It is the old formula: you are at the bottom of the screen with a laser cannon and you can move left and right. The robotic war machines are hovering above you moving slowly left to right then right to left, all the time lobbing plasma bolts at you. Some of the galactic interlopers swoop down towards you and try to kill you.

When you have killed one of the war-droids, another lot (slightly different shapes this time) appears and you have to start all over again. Every few 'screens' you get the chance to score some bonus points in a shoot-out with some strange looking aliens that seem to resemble helicopters. This is quite an interesting feature, but is the only original addition in an otherwise clichéd plot.

**Strike Attack** from Micro Mart is intriguing, to say the least. It is an attempt to simulate the attack profile of a 'strike attack' aircraft en route to its target.

It does this perfectly well, except for a few minor faults; the screen display is not very clear as, for some reason, the program fails to clear the screen of old messages before printing new ones; the abbreviations used in the status table are not very clear in their meaning; the screen scrolls every now and again, which corrupts both the status table and the graphics; the few graphics that there are are painfully slow (the program is 100 per cent Basic). At £6.50 the program is grossly over-priced. What more can I say?

**The Castle**, from Bug-Byte, is a fairly standard text-only adventure, or at least it appears to be until you play it for any length of time. Without giving too much away, let me quote an example: I was standing next to a chasm and had almost given up trying to get over it. As a last resort, I tried typing in the *Help* command and, in return, the program gave me a rather meaningless phrase, which I worked out to be an anagram of *Fly Chasm*. So I typed *Fly Chasm* into the computer, to which it replied *How?*

After many attempts at guessing the answer to this question, I finally gave up, and, as I am prone to do in such circumstances, typed in something which at the time I thought was stupid, ie *Flap Arms*. To my amazement, however, this was the phrase that the program was looking for and, before I could say *Magic Mushrooms* I was informed that I was on the 'Other Side'.

The rest of the game continued in a similar vein. I won't give any more examples for fear of spoiling your fun. All I shall say is that I found it very hard going indeed if you enjoy playing adventure games, and you like a challenge, then I recommend that you buy this program.

The other Bug-Byte program I looked at, **General Election**, did not impress me quite as much. The program is a simulation of a general election. Each player picks the party of his choice (Labour, Conservative, Liberal or SDP) and then has to gain as many seats as possible, not to mention public support (in the form of national and regional swings), before the general election is called.

## Rolling the dice

Although I found quite a large amount of the program fairly interesting, there were a lot of things that I didn't like about it. I got the impression, while playing the game, that it had been converted from a board game. For a start, two to four players were required to play the game — there was no option in which human could play the computer. Secondly, most of the game seemed to be based around rolling a dice.

In fact, the only part of the game that actually required any of the players to think at all was when they had to choose a policy, and even that became fairly automatic after a while. I think that Bug-Byte are going to have a hard time selling this program. However, if they had released it a few months ago...

**Aquaplane**, from Quicksilver, is an original idea, as far as I know. Basically, you have to manoeuvre a speedboat and accompanying water skier around various objects that appear in its path. On the first level, you merely have stationary rocks and floating logs to cope with. Then, on the next level, things start to get harder as yachts zig-zag all around you.

Next you have rocks, logs and very fast-moving boats to contend with. And, if you can get past them, on the next level you are confronted with sharks which actually snap at you.

The controls are very simple — you can move the boat up and down and you also have a throttle control. However, to make things a bit more difficult, the water skier starts to swing around if you move up or down with the throttle on.

Graphically, the program is very impressive indeed. All of the graphics pixel scroll, even though there is always a lot happening on the screen at any one time.

The last program I will consider is **Xadom**, also from Quicksilver. The game is basically a cross between an 'arcade' type game and an adventure game, a real time adventure in fact. The scenario is typical adventure; recapture a piece of stolen treasure and use it to operate a teleport device.

The game has most of the good features of an adventure game, problem solving, map making, etc, without some of the more irritating problems. For example, you never have to worry about how to phrase a command, since the only controls are up, down, left, right and fire.

One of the more useful features of the game is the fact that you can be reincarnated several times in each game without losing any of your possessions. However, a number of points are deducted each time you die, just to ensure that you give your life the respect that it deserves. This game is good all round, although there aren't any particular features that make it brilliant.

The most notable thing about the software in this review is the variety, both in quality and the types of program. In general, I think I can say that the standard of the software being released is improving, although there is still a lot of pretty abominable software floating around.

# A character change

Peter Bartley explains how to define your own graphics in the third of a six-part series for the Vic20

Have you ever wondered what goes on inside your Vic? Obviously the computer isn't using the same keywords that we use when we type at the keyboard. It is, in fact, working in a "lower" language, which makes the speed of execution of programs much quicker.

So, whenever the Vic "communicates" with us (error messages, etc), or whenever we communicate with it, there is a fair amount of translation going on inside! To do this, the Vic has to have a set of our characters. The ability to change these characters is the basis of high-resolution graphics on the Vic (user-defining the graphics). Here is a simplified view of what we must do to obtain them (they are much, much better than Vic standard graphics).

When you turn on the Vic, it "does the housework" (sets registers, flags, etc, which is why you only have 35K to play with, rather than 5K). This "power-up" routine is "burnt into" Rom, and includes data for forming the character alphabet. We cannot access Rom (that's why it's called Read Only Memory).

So it would seem, at first glance, that we cannot change the characters directly. Instead, we "read" the character set from Rom into Ram. Each character is stored as a set of eight bytes, so to transfer 64 characters (the usual number) we need to read  $64 \times 8 = 512$  bytes from Rom. We also need somewhere to put the data!

There are various suitable areas in Ram for this data, but by far the best is from location 7168 on. To transfer the information we type:

```
10 FOR A=7168 TO 7679:POKE A,PEEK(A+25600)
NEXT
```

The *Peek* value here gives values from 32768 on, which is the area in Rom containing the upper case/lull graphics data. Now we need to tell Basic to read its character information from our set in Ram rather than the Rom set. Fortunately for us, this is very easy to do on the Vic. Register 36869 controls the "pointer" which "indicates" where to read character information. Change this and you change the location where the Vic gets its characters from. A value of 255 here does the trick, so enter:

```
20 POKE 36869,255
```

Running the program has two effects: one, the cursor disappears (don't worry about it), and two, all the graphics characters on the screen turn into "splooges". This is because we haven't read their data into our Ram location.

There is one more thing we must do before the fun starts, and that is. *Protect* our character set. You see, any Basic programs you write begin at location 4096, so when it's running the memory is filled out from this location. If we're not careful,

our graphics may be overwritten by Basic blurb. Type:

```
1 PRINT FRE(0)
5 POKE 5228,POKE 5626,CLR
9 PRINT FRE(0) END
```

Run the program. See? We have lost 512 bytes of memory. These bytes are the ones which contain our character data. Delete lines 1 and 9. Right, we're in business!!

Add the lines in Figure 1 to your program and run it. See? — a row of "spacies"! Notice that they started off as As. What we have done, in fact, is overwritten the data concerning A in our Ram character set with that in line 50.

Imagine an  $8 \times 8$  grid of empty cells. Then imagine some of the cells filled in to make a pattern. Now consider the eight horizontal rows. If each shaded cell is represented by a 1, and each empty square by a 0, we have eight binary

numbers which fully describe our grid (see Figure 2).

So, what we do is design our character on an  $8 \times 8$  grid, convert it into eight binary numbers and convert them into eight decimals (these are the "eight bytes" per character I mentioned earlier!). Then, you *Poke* the data into your Ram character set to produce hi-res graphics (in line 10 we transferred 512 bytes of character data into locations 7168 to 7679. The eight bytes concerning *a* are from 7168 to 7175, concerning *A* from 7176 to 7183, etc). Simply choose which character you wish to overwrite and begin *Poking* your new data here using a loop as in line 40 (the C is a delay loop only. Delete it, but don't forget to make *Next C*, a simply *Next C*).

This is the best part, so enjoy yourself designing new spaceships, symbols, etc. As I said, you have 64 to choose from! To reduce the tedium of all the sums, here's a binary/decimal converter (see Figure 3). Note the binary is entered as a string, and the "mug-trapping" in lines 20 and 30.

Having changed the characters, it is easy to see how they would live up any program! Next week we will take a look at sound effects.

# A tour of the board

*Denis McCarthy presents a simple program to explore the intricacies of the Knight's Tour*

This program for the 16K Spectrum demonstrates a sequence of moves known as the *Knight's Tour* to chess players. A chessboard and a knight are used in this sequence. The *Knight's Tour* involves the knight moving on to every square of the chessboard, without going on to a square it has previously visited. All the moves have to be made just as the knight moves in a normal chess game.

For those of you not familiar with the movement of the knight — it moves in an L-shape. If you imagine a 2 x 3 rectangle drawn on the board so that the knight

occupies one corner of it, then the knight can move to the opposite corner of that rectangle. There are many such rectangles which can be drawn and hence many possible moves are available. This makes the *Knight's Tour* a difficult trick to do.

The user enters the square which he wants the knight to start its tour from — instructions on how to do this are given in the program. The whole display is used to show various facts and details about the tour, eg move number, current position, diagram of squares visited so far and the last move in algebraic notation.

The program centres around H\$, which holds a chain of moves. This chain is broken into, depending where the knight starts, and a new chain is formed. This is worked through until the end is reached, by which time the tour has finished.

On Running the program, you are shown a chessboard display and are requested to enter the square you wish the knight to start its tour from. H\$ is sliced at the place for that particular starting square (Lines 240 and 250).

The next screen display shows two boards. A large board shows the knight's current position, while the smaller board is filled in with knights, to show where the knight has been.

When the *Knight's Tour* has been completed, you are given the chance to see it again, with a new starting square if you wish.

# Put on the map...

John Meech presents a simple geography quiz  
for the BBC model B

This program is designed to be the basis for a very flexible geography quiz game. It contains a workable quiz of 10 cities in the UK, but additional cities, towns, rivers or any other kind of location can be added as desired.

The essence of the quiz is this: the name of a place is displayed and the player must move the small flashing cross to the location on the map where he or she thinks that place is located, before pressing 'C' to see if they are correct. This process continues until all the set places have been tested.

The program is structured for ease of modification. To change the types of location tested for, simply replace the data at the end of the program with data of your own. To find the location of the place, use

an atlas to find its correct position and then match it on to the grid overlay (fig 1). The co-ordinates start from 400, 0 to allow for the scrolling text window, and the small squares are 40 by 40 units. Enter the X and Y co-ordinates after the place name at the end of the program, then change the value of *Number* to the new number of data items (line 20).

I have included a modification to allow the use of joysticks rather than the keyboard, but for those who want to try modifying the program themselves you could try to enable the program to read data in file form from tape or disk, or modify the character printed at the correct location (at the moment this is a star, but it could be the outline of a power station, etc. by using user-defined characters).

## Program description

Line	
10	Dimensions the arrays for holding place name and co-ordinates
20	Sets the number of data items used
30	Sets mode and initial values W and JJ (A counter and the score)
40	Draws a border around the map
50-100	Read the co-ordinates and draw the map
140	Sets the cursor keys to produce a value
150	Sets the cursor keys to produce a value for INKEYS
190-210	Form main program loop
220	Calculates and prints the score
230	Plays a short tune if the score is high enough
270-340	Contain the data used to draw the map
360-430	Draw a cross at X Y. The cross is drawn twice to erase itself and prevent erasure of the map by using GCOL3,3(X-OR white
440-560	Check the keyboard and change the co-ordinates of the cross accordingly
570-710	Print the instructions and read the place names and co-ordinates into arrays
720-790	Check to see if the guessed location is correct. It plots a point where the guess was made and draws a star at the correct location. It then increments the score
800-860	Print the name of the city to be found with a reference number in the text window
880-930	Plays a tune if the score was high enough
940-1040	Contain the data for the cities

## HARRIER ATTACK!

Any ORIC-1  
only  
£6.95

### ORIC-1 SOFTWARE

#### HARRIER ATTACK!

At last a pure machine code super-fast action-packed, highly addictive arcade-style game requiring great skill. The harrier takes off from an aircraft-carrier and flies over seaborne defenses attack enemy installations on a nearby island. The harrier has bombs and cannon fire with which to protect itself and make its own attack. If it flies too high it is detected by enemy jet-lighters (which it may counter-attack) or it runs into the mountains which also vary with every new game. But the island is heavily defended by anti-aircraft rockets and tanks which again the harrier may counter-attack or try to fly through. A tally is kept of fuel speed altitude ammunition plus player score and high score. Finally the harrier must make its bomb-run over the enemy base before returning past more hostile shipping to its own carrier. This game is everything an arcade fanatic could ever hope for - with full colour graphics and explosive sound!

£6.95

#### LUNAR LANDER/ASTEROIDS

Learn how to make your own arcade games. With this tape you can play two exciting games, then list on the screen full instructions explaining how they work. A must for all owners of an ORIC-1.

£6.95

#### ASSEMBLER/DISASSEMBLER

With A4 note pad and full instructions

£8.95

## TO MAKE A SUPER GAME INTO A FANTASTIC GAME YOU NEED SOFTLINK 1.

This will allow you to use a Kempston type joystick with all the following Spectrum games:

**Arcadia, Penetrator, Horace Goes Skiing, Spectres, Flight Simulation and Space Zombies.**

ONLY £4.95

### SPECIAL OFFER

Spectres plus Softlink 1 ..... £11.00

Arcadia plus Softlink 1 ..... £9.00

### SUPER SOFTWARE FOR YOUR CBM 64

Cyclons, Pakacuda, Escape MCP, Centropods,

Anihilator, at only £5.65 each

### FOR YOUR UNEXPANDED VIC

Escape MCP, Pakacuda, English Invaders, The

Catch, Paratroopers, Animatter Splatter, at only

£5.65 each.

Crazy Kong only £6.50.

### FOR ANY VIC

Catcha snatcha, Wacky Waiters, Arcadia only

£5.25 each.

### FOR YOUR VIC PLUS AT LEAST 8K

Critters, Cyclons, only £5.65 each.

New for your 64

Star Trek, Panic 64, Frogger 64

Cheques and postal orders to

# Search and destroy

Shaun Freeman presents *Starbase*, a new game for the Dragon

The purpose of this game is to destroy three alien ships which are moving at random around the screen. A cross, which represents your sight, can be moved about the screen by the cursor keys. Pressing the spacebar fires your photon lasers.

Your fuel supply is shown at the bottom of the screen — when your fuel runs out, the game ends.

There are five levels of play. But, after you complete each level, you will need progressively more fuel in order to qualify

for the next level, since your ship will be more battle-worn. The amount of fuel needed increases by 20 units each level.

If you complete level 5, you will be awarded a rating, depending on how much fuel you have used.

## Variables

x,y	Position of cross
ax,ay bx,by cx,cy	Position of alien ships
fu	Fuel supply
en	Fuel needed for quality for next level
px	Position of planet

# The final countdown

Concluding our series on machine code master

## Module 1.15

Now that we can give a name to the file in which the information contained in an area of memory is going to be stored and can specify the start point and end point, we can proceed to enter this module, which will store the information on tape or disc.

## Commentary

Line 14125 simply checks that the user has not defined a block of memory whose end point is before its start.

A file is opened in line 14130, in this case an output file, with the destination of the information being dictated by the value of the variable *Dev* (device). In the listing of this program it is set to 1 (line 10035), which directs the output to a cassette recorder. If you are using a disc drive, then *Dev* should be set to 8 in line 10035.

Once the output file is opened, the first two pieces of information to be stored in it are the start address (*AD*) and the end address (*EA*). Later in the program, a facility will be added to allow you to change the current device number at will.

The contents of each byte in the block of memory to be saved are now stored one by one in the file. At the end of the loop the file is closed.

## Module 1.16

This module is simply the mirror image of the last one. Instead of placing information into a file, this module takes previously stored information from the file and places it back into the computer memory.

## Summary

Having entered the whole of the Monitor

you are now free to play about with it, though its full power will only be realised once the rest of the Mastercode program is entered. Try entering a new line:

0 A=13

Call up the menu option which allows the memory to be changed and alter the contents of byte 805 hex to 8F (143). List the program to -1 and you will see that your first line has changed to a Rem statement (143 represents Rem in the program file). Unless you are very sure of what you are doing it would be wise not to try to change too many other memory locations at present, and certainly not before you have properly saved your final version of the monitor. If you do want to mess about, try modifying some of the colour attribute bytes from D800-D8FF hex, the colour attributes memory of the screen.

This is an extract from *Commodore 64 Machine Code Master* by David Lawrence and Mark England, published by Sunshine Books

## OPEN FORUM

**Open Forum** is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

## Boot Hill

on Oric

In this game, written for the 48K Oric, you are the hardest sheriff in the West. Your job is to clear the dirt and grime off the streets.

You, the cowboy on the left, do this by firing using the space bar, found on the bottom of your ergonomic keyboard. You can also move up and down with the cursor control keys to the left of the space-bar.

Your aim is to hit the meanest shot in town which is on the right of the screen

and controlled by the computer, but the cacti don't help.

A running score is kept above each cowboy and once someone has been hit there is a little surprise. (NB. I'm not very musically inclined.)

Two machine code routines are used, to help with the driveability of the Orc. The first, located at address 40600 prints both cowboys to the screen, and the second at 40460 is the firing mechanism. Once the program has been typed in and *Run* there is a short pause while the code is being stored. As an added difficulty, if two bullets collide, the outcome occurs almost at random. So good shooting!

## Atomic Grid

## on Commodore 64

In this game you must strategically place spent rods of atomic fuel on an  $8 \times 8$  grid of cells such a way as to leave your opponent occupying none of the cells. In your go you may place one of your rods anywhere on the playing area, provided that the cell is either vacant or occupied by one of your own pieces.

The number of fuel rods that each

square can hold is determined by its position on the board. In the corners this number is two, on the edge three and, elsewhere on the board four. When the maximum is reached the contents of that cell explode onto any adjacently surrounding squares and the number of rods in any of these squares is incremented by one. Since this can cause the number of rods in the squares affected to reach the maximum value, multiple explosions are possible. Once exploded onto the square and its contents come under your possession. The cell that originally exploded and any

that explode subsequently are emptied.

Enter your move in normal cartesian co-ordinate form, i.e. (X,Y). The number of rods in any square is printed in the centre of that square. The winner is the first to leave his opponent without an occupied square.

### Program notes

90-170	Set up screen display
200-250	input move
1000-1050	Display cell contents
2000-2400	Explosions
5000-5020	Empty exploded square
9000-9030	Determining position of square and hence calculate its maximum value

## Security

### on Ace

This is a program for the Jupiter Ace computer which disables the listing functions. The routines within Forth programs are very easily transferred from one program to another. It is easy to extract a complex routine from someone else's

program and then utilise it in your own. Perhaps this is a good idea allowing the wide dissemination of ideas and a pooling of programming knowledge.

However, if you have just written some amazing routine which you wish to keep to yourself at the moment then this program should prove useful. It disables *Vlist* and *List* amongst others so that the anatomy of a Forth program cannot be examined. The

way it does it is extremely simple, it just provides dummy definitions with the same names as the functioning words and also makes it difficult to edit them out.

When you have written and debugged the program which is to be protected, simply type in the security program. Try executing *Vlist*, etc. and you will see that the only response is an OK printed on the screen.

## SECURITY PROGRAM

Written for the Jupiter Ace  
by Simon Cross. 1983.

## Letter Writer

### on Dragon

This is a letter writing program that uses the computer's ability to handle files in loading or saving letters on cassette.

This program should be very easy to translate for other computers as only the printer commands and file commands will differ (Chr\$(15) sets the printer to single width characters.)

LS(x,y) is the main string variable store. All # signs should be typed in as

hash signs.

### Program notes

20-70	Input the address
210-350	Typing in the letter
390-520	Save the letter on cassette
540-830	Print out the letter
880-970	Loading the letter from cassette

```

A VIDCOM CREATION

# MIJID, BECAUSE YOUR PRODUCTS HAVE GROWN UP...

Video games: a 75% growth in 1982. A spectacular increase, giving food for thought! Home micro-computers and video games are nearing full-maturity. Having reached this stage of development, they can only strengthen their impact with the help of a vigorous commercial strategy. And thus Vidcom saw the need and created Mijid.

## COINCIDING WITH VIDCOM, MIJID IS EXCLUSIVELY RESERVED FOR MICRO-COMPUTERS AND VIDEO GAMES

If you are a publisher, programmer or analyst, manufacturer or distributor, the success of your products will be enhanced by attending Mijid.

## FIVE DAYS IN WHICH TO MEET PROFESSIONALS FROM AROUND THE WORLD

retailers and distributors creating and developing their sales networks, producers, from all domains of the software industry, looking for new programming ideas, writers and programmers negotiating rights for promotion, adaptation and distribution, international journalists, there to report on your new products.

## MIJID IS A VIDCOM CREATION

and there is a strong tie between these two shows. It's normal: their interests are complementary. Furthermore, the professional attending Mijid will be able to count themselves among the regular, prestigious Vidcom attendance. A solid guarantee for contacts and contracts.

Get ready for the next surge of growth, attend Mijid.

# Mijid

## MIJID AND VIDCOM: A COMMON PASSPORT TO NEW COMMUNICATIONS

The first International Video Games, Personal and Home Computer Market  
Palais Croisette Cannes (France), 3-7 October, 1983

Trade only

Video magazines and video games: a new dimension. Excellent! Please come to the world of video games and video magazines. Examine the latest titles.

Video games:

Video magazines:

A new dimension in video games and video magazines.

A new dimension:

A new dimension in video games and video magazines.

## Tony Bridge's Adventure Corner

### Fourth generation

We are now playing the 4th generation of text adventures.

The first generation included all the original main-frame programs, with output being sent to the printer (obviously in text form only — no graphics). The second generation of programs had their text displayed on-screen and supported by, admittedly crude, graphics. This was the first generation to appear on microcomputers.

The third generation featured high-resolution graphics, and the occasional animated sequence.

The current generation, as exemplified by *The Hobbit*, allows independent action by the characters in the adventure, so that while the overall pattern is always similar, each game is unique in detail. The difference, of course, between the generations of adventure and the generations of computers, is that all the various generations of the game co-exist quite happily, and are not mutually exclusive of each other.

What will be the future of the game (or hobby, as I suppose we should really label it, for that is what it is to many people)? There are software writers who believe that the future of adventuring lies in arcade action. Some very good games have been written (see *Ghost Encounters* and the like for the Ataris and *Jumpman* for the Commodore 64, which contain adventure-like problems in an arcade setting), but I get as many people writing to me, bemoaning the rise of the arcade adventure and calling for a return to pure text, as people asking for a recommendation for a good arcade game.

No — I think that arcade adventures will exist and progress alongside the text adventure. But, the text adventure itself will evolve. I've mentioned *The Hobbit* already as an example of the current state-of-the-art, and I think that the next generation will build on techniques seen in this program. Thus, the inter-reaction between player and character will become more natural, and the graphics used to describe each location will reflect the changes in the environment.

As bulk storage becomes cheaper, as indeed it must over the next couple of years (witness the Microdrives) more and more data will be used by programs in creating life-like scenarios and situations.

It is a corollary of Parkinson's Law that adventurers will necessarily require ever more data and memory (even unto the nth K) to satisfy their need for ever more complex puzzles to solve, and more locations to explore — remember when you thought that 16K would be more than you needed? And now 48K seems a bit of a squeeze, doesn't it?

Another possibility for future adventure programs is that of multi-player games, using the networking systems that are appearing for home micros.

This has been a brief look at present trends. There will probably be a revolution at some point, to usher in a completely new regime in the adventuring world, and I, for one, look forward to being a citizen of the new state of affairs.

If you've thought about this, and have your own ideas about how adventuring may evolve, write and let me know — the best vision of the future may even win a small prize (so state your computer when you write).

*Valhalla* — mentioned in this column some weeks ago, this program is, apparently, going to set the world alight. OK, I know you've heard that before, but some of the screen shots that I've seen do point to something a little out of the ordinary. At the time of writing, the advertised release date has come and gone. But, by the time you read this, we should have seen something of the program itself. And as this program, by dint of publicity if nothing else, seems to be an important successor to *The Hobbit*, I'll keep you posted of any news.

Now we descend to the basements of those business institutions where the huge mainframes are kept busy far into the night — do we find the employees slaving away at Mammon's balance books? No, we do

not — they're all playing adventure on the company mainframe, at £60 a minute!

A lot of people have written to me to tell me that their introduction to the world of adventure was via a PDP or IBM machine; on which they would toil after working-hours, trying to solve the mystery of the plover room, or the use for the black rod. Keith Brown, for instance, writes to tell me of an adventure program called *Dungeon*, which he played on a VAX mainframe some time ago. This was the one with a house by a river, and a trapdoor beneath a rug in the lounge. Keith would like to know if this is commercially available.

You don't tell me, Keith, what machine you have now, but there are many implementations of the original mainframe adventure programs for most of the modern home micros. Level 9, for example, have a good range of similar games for the BBC, Spectrum and Nascom machines. Any Scott Adams program, for the Commodores and Atari micros, will also have the flavour of those mainframe games as will the Digital Fantasia series of text adventures, which are available for the Atari and Spectrum.

More about mainframe adventures next week. In the meantime... don't ask a computer to play global thermonuclear war.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Are you stuck in an adventure? Are you faced by a problem that seems insurmountable? Adventure Helpline may be the answer.

Adventure Helpline is, quite simply, designed to put adventurers in touch with one another. Where you may be stumped by a baffling puzzle, a fellow adventurer may be able to help. By the same token, you may be able to help other people with their problems.

If you are having difficulties with an adventure, fill in the accompanying coupon and send it to:

Adventure Helpline  
Popular Computing Weekly  
12-13 Little Newport Street  
London WC2R 3LD

We shall publish Adventure Helpline entries each week in their own special column.

## Self Adhesive Cassette Labels

★ **CASSETTE LABELS ON ROLLS** - Concess with tractor head perforations to allow them to be printed in most modern computer printers. Now you can have instant labels exactly when you need them! Minimum order 500 labels. £11. Cassette labels on sheets - 15 labels per sheet. These labels are suitable for rapid application by hand to cassettes and can easily be printed on any local instant print shop. They are also ideal for use in typewriters or word processors. Minimum order 100 labels - £2.50

★ **SMALL COMPUTER LABELS** - Many micro computer users are finding that they are able to provide a unique and profitable service to businesses in their locality. We manufacture a wide range of small computer labels at very attractive prices. They are used for so many purposes that it is difficult to list them, but price changing, tagging, coding and marking are some examples.

**NEW** - Sampler pack of all of our different types of label - £2.00

All the above prices include VAT & carriage. Excellent quantity discounts. **PLEASE SEND 16p STAMP FOR PRICE LISTS AND SAMPLE LABELS.**

## ROSE SOFTWARE

**EDUCATIONAL SOFTWARE FOR THE  
16K or 48K SPECTRUM**

1. "O" Level Maths Revision - GEOMETRY - 6 programs
2. "O" Level Maths Revision - EQUATIONS & INEQUALITIES - 6 programs
3. "O" Level French Vocabulary Revision - 6 programs
4. OUAZER - 4 quizzes plus maze for all the family to enjoy

We have a large selection of educational programs for the Spectrum. Cassettes £5.95 each (inc p&p) or send sae for catalogue to

### ROSE SOFTWARE

148 Widney Lane, Solihull, West Midlands B91 3LH  
(ZX81 programs also in stock)

**LUSITANIC** - save the passengers from the shark-infested waters.  
£4.95 from your local dealer or direct from Coppice Software.

A Dragonfire Program

7 March Street, Kings in Lindsey, Gainsborough, Lincs.

## WIN THE POOLS?

48k

### SPECTADRAW 2

A Pools Prediction Program for the 48K Spectrum microcomputer. The program looks at the recent form of the teams playing in each week's English and Scottish football league matches and then infers on a large database to see what has happened in the past when teams with similar form meet. It can then identify the matches which are likely to yield draws and output suitable predictions.

The program is supplied complete with a database tape containing data on over 7,500 matches, and a comprehensive instruction manual. For £12.95 inclusive (cheques POs payable to B. S. McAlister). SPECTADRAW 1 DOWLEAZE, CHINNOR, OXFORD. OX3 4TD

VCS **ATARI** 400/800

## COMPUTER STUDIES

Paul Silverman of Adelaide Road, Hampstead, London, writes:

**Q** I am interested in taking a GCE 'O' level in computer studies and wondered whether you have any information on the syllabus or of any correspondence courses or classes available. I am very knowledgeable about computers but would obviously have to study to pass the exam.

**A** The place to find the answer to your question is your local library which should have copies of the various syllabuses.

I would suggest, however, that you find a course before you look for a syllabus, as the requirements differ from board to board, and you will need to know which board you are attempting before you can get to grips with an individual syllabus. You might like to try night school or an adult education centre — as a rule, if 12 to 15 people want to do a specific course, then they will do their best to try and organise one.

## HALF A K

Dennis Trane of Cheshire Road, London NW10, writes:

**Q** I am a little confused as to how the 2114 chip works. I know that a pair of them will give you 1K of memory, but according to a friend a single one will not give half a K of memory. Yet I can remember some years ago, when I first considered buying a home computer, some micros had only a quarter or half a K of memory. How does a chip like the 2114 work?

**A** To explain how a 2114 worked, would take several chapters of back-

ground to micro electronics. Essentially, your friend is correct in that a single 2114 will not give you 512 bytes. This because it has only four data lines. If we had a computer that had four bits to the byte, instead of the 8 we are used to seeing, then a single 2114 would give 1K bytes.

Instead, what a single 2114 does, is give 4 by 1024 bits, not 8 by 512, even though the total number of bits is the same. The important fact to look out for is how those bits are distributed, and that means looking at the number of data lines available. Because of this a pair of 2114s are needed to give 1K of 8 bit bytes because only a pair, or multiples thereof, will supply sufficient data lines. If we were using a 16 bits to the byte computer, then it would take four 2114s to make 1K bytes.

## TEXAS PROGRAMS

Neil Swift of Widnes, Cheshire, asks:

**Q** Why is there are not more programs available for the excellent Texas machine?

**A** I think it's improving. After three years and a drop in price of some 70 per cent, there are signs that the TI computer is beginning to sell in sufficient quantities to interest independent manufacturers.

While there are still few programs on the market, I would expect to see some material available by the time of the Barbican show (September 28-October 2). I do hope that the planned introduction of patented hardware for the computer does not hinder this development, otherwise the computer might slip back into its undeserved obscurity.

## TRAIN CONTROL

Mark Metcalf of Altmere Avenue, East Ham, London E6, writes:

**Q** I am looking for a suitable I/O port to let my ZX Spectrum control a Hornby train set. The maximum number of trains running at the same time is nine.

**A** The only two ports that I can think of that might help you both use the 8255

chip, which gives you 24 control lines. One is by Kempston, the other by Epprom Services. The latter has change-over lines that will make it easier for you to monitor the signals. You will also have to make sure that you have a stackable connector; ie, the sort of motherboard that leaves you with a complete edge connector after your port is in place.

## LOOP THE LOOP

S D Robbins of Menear, St Austell, Cornwall, writes:

**Q** I have a program that allows you to enter variable data into a For/Next loop, string array. The Dim statement is Dim AS (19,32). A Gosub statement will let you come out or go into the loop on each count, without losing data.

Can I manually come out of the loop at any time, do work at any part of the program, and then return to the loop on the count I left it on? All this would be done, of course, while the program was running.

**A** This is a very difficult question for me to answer, because I do not know what computer I am dealing with (at least one person a week still forgets to tell me this and it is not always possible to work it out). Fortunately, in this case, the general rules are similar for most of the common home computers.

Essentially, if you do not change the value of the variable that controls the loop, then it will retain the value it had when you came out of the loop to work on the other section of the program. What happens on most computers is that when you go back to the loop, a few extra bytes of garbage will be taken into the Gosub stack with it. So, if you do this several times, there will be a risk of filling up the Gosub stack, which is likely to cause a systems crash (the ZX

computers get round this by transferring the values into the variables automatically).

To get round the problem on other computers, before starting work on another section of the program, set a new variable to the current value of your loop. So, if you have a loop say For N = 1 to 19 and you come out after 10 loops, set Let Z = N and then when you come back you can work on a loop Z to 19.

One thing to beware of is that when you return to the loop you do not go back to the line that sets it, eg: 10 For N = 1 to 19 if you go back by a command such as Goto 10 then you will, of course, reset the value of N and lose the place you have tried so hard to keep.

## GENIE CONVERSION

Andrew Moore of Priory Road, Blidworth, Notts, writes:

**Q** I am writing to you about my computer which is an EC2000 Colour Genie. I tried a few of your programs, but they were not successful when I tried to convert them. Couldn't you include more programs for Genie owners?

**A** The Genie, like the Tandem Colour computer has suffered badly with the introduction of the Dragon, which apparently offers similar facilities at a cheaper price. The main reason we do not deal with the Genie is that we do not get any material submitted for it!

One development that you might find useful is the 'Colour Genie Users Group' which has recently been formed with the help of the National TRS80 users group. They have started to publish a magazine called *Chewing Gum* which is devoted to the Genie. You can get further details from Colour Genie Users Group, 46 Highbury Avenue, Bulwell, Nottingham NG6 9DP.

**Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek It* to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, 12-13 Little Newport Street, London WC2R 3LD.**

**EXECUTION** is based on the old pen and paper game of Hangman but requires only one person to play it. Excellent use of the Spectrum's Hi-res colour graphics and sound facilities and a memory of around 150 words with a total vocabulary of over 1,000 words make this old favourite unbeatable value at only £3.50

**SPECTROCOMP** is an advanced Microcomposer for the ZX Spectrum. Create your own tunes, edit them, store them and play back in any tempo. Your tunes are displayed on musical staves musical notation. Print — enables your ZX Printer to print your music. Copy — will copy entire musical passages. This is the best composer on the market and is great value at only £3.99.

# NEW RELEASES

## TWISTED

JK Grege Enterprises was once the home of Malcolm Evans, who went on to found New Generation Software.

Since his departure, little has been heard of the company — until now.

The new release is a sort of 3D Ground Attack called *3D Vortex*. You must guide your craft along the twisting and turning Vortex avoiding the sides and the various strange life-forms that lurk there.

Claimed features of the game include quality 3D graphics and high-speed machine-code animation. The game is compatible with most types of joysticks.

**Program** *3d Vortex*  
**Price** £5.95  
**Micro** Spectrum 128K  
**Supplier** JK Grege Enterprises  
16 Park Street  
Bath  
Avon BA1 2TE

## OVERTONES

*Harrier Attack!* is a high speed machine code game for the Oric. Your task is to take off from the deck of an aircraft carrier and fly to a designated target, without getting shot down.

Assuming you manage to avoid the enemy's defences, you then have to bomb the enemy base and finally fly back to the carrier without running out of fuel.

There is a choice of skill levels and the game appears to be basically *Scramble* with

overtones of *Flight Simulation*.

**Program** *Harrier Attack*  
**Price** £6.95  
**Micro** Oric 1  
**Supplier** Durell Software  
Castle Lodge  
Castle Green  
Tunton TA4 1AB

## 3 PARTS

*Pearl Harbour* is a fairly epic sounding game for the 48K Spectrum — in three parts.

In the first part you control the movement of three squadrons over a high-resolution map and attempt to intercept five Japanese squadrons moving towards their target.

Assuming you can find them, the screen changes to show the view from the cockpit of a P40 fighter and it's up to you to shoot down the Zeros before they reach their destination.

The final section puts you on the deck of a ship moored in Pearl Harbour and planes swoop down intent on your destruction. Since, true to history, your destruction is the most likely occurrence, the best you can hope for is a place on the high scores hall of fame.

**Program** *Pearl Harbour*  
**Price** £5.95  
**Micro** Spectrum 128K  
**Supplier** Sabresoft  
13 Bower Avenue  
Hazel Grove  
Stockport  
Cheshire

## CONVERTER

There is, as every Dragon owner knows, a close similarity between the Dragon and the Tandy Colour Computer. The problem is that no one has been quite sure just how close that similarity has been, i.e. do you risk going out and buying tapes for the other machine on the off-chance they will work on yours?

Although the Tandy isn't a big seller here, in America it has sold well and ensured a large software backup. Obviously, Dragon owners would like to have access to all those games.

One enterprising solution to the problem is *Dragon Crasher* from Elkan Electronics.

This converts programs from one machine to the other — provided they are written in Basic. A version which will handle machine code is expected soon.

**Program** *Dragon Crasher*  
**Price** £7.95  
**Micro** Dragon 32 Tandy Colour  
**Supplier** Elkan Electronics  
Freepost 11  
Bury New Road  
Prestwich  
Manchester M25 6LZ

## MONITOR

What every budding machine code programmer needs is a monitor. Kenema Associates claims, of course, that its Oric monitor is the best.

Facilities include breakpoint display, full hexadecimal arithmetic hex and disassembly display, register display and modification and various kinds of search.

**Program** *Oric 1 Extension Monitor*  
**Price** £15  
**Micro** Oric 1  
**Supplier** Kenema Associates  
1 Marlborough Drive  
Worle  
Avon BS22 0DO

## LESSONS

Rose Software has issued a number of programs concerned with education on the Spectrum.

The latest is *Young Learners 1* which contains four programs — *Abacus*, *Telling the Time*, *Shopping* and *Snakes and Ladders*.

**Program** *Young Learners 1*  
**Price** £5.95  
**Micro** Spectrum 128K  
**Supplier** Rose Software  
148 Wadney Lane  
Sohbuhl  
West Midlands  
B91 3JH

## IMPOSSIBLE

*The Impossible* is the title of a puzzle so difficult that most people claim that it is well impossible.

This turns out to be a computer version of that old school maths puzzle where you have to connect three houses with gas, water and

electricity without letting any of the lines (pipes) cross.

It would be unfair of me to say whether the task was possible or not, but it is certainly not straight-forward.

The program runs on any Spectrum and, of course, your machine will not allow you to cheat.

**Program** *The Impossible*  
**Price** £5.45  
**Micro** Spectrum 128K  
**Supplier** D J Minch  
Farm Cottage  
28 The Street  
Barton Mills  
Bury St Edmunds  
Suffolk IP28 6AW

## SORCERY

Vortex Software is well known for its *Android 1* program which was the classic high-tension arcade game format.

However, the company has also moved into adventures with *Serpent's Tomb* — initially for the ZX81, but soon for the Oric and Spectrum.

The aim of *Serpent's Tomb* is to retrieve a shield from the depths of an ancient structure. Part one is the story of Xetrow, with the main adventure forming part two. Xetrow, it seems, lost the shield in the first place.

The game features 25 chambers on two levels, a vast maze, a large vocabulary and all the appropriate trappings of swords, sorcery, magic and demons.

**Program** *Serpent's Tomb*  
**Price** £3.95  
**Micro** ZX81 16K  
**Supplier** Vortex Software  
26a Crawford Road  
Hatfield  
Herts AL10 0RG

# NEW RELEASES

## UTILITY

Base Two Software has two useful utility programs on one cassette. *Fill* will fill in any shape you create, via a machine code routine that can be called from your own programs.

*Compressor* does just what it implies, ie, it compresses the screen of your Spectrum — the advantage of this, is the amount of memory you can save. The author claims this can be up to 3.7K on some programs.

**Program** *Fill/Compressor*  
**Price** £3.75  
**Micro** Spectrum 16/48K  
**Supplier** Base Two Software  
9 The Copse  
Lindfield  
Sussex

## MUSIC SHAPE

BBC-owning Bach fans — and I'm sure there are many — will be most interested in a new program from CompuSoft.

*Toccata* — as its name suggests — simply plays Bach's famous organ work with an accompanying moving picture showing the 'shape' of the music.

If it all sounds a bit passive for the average *Space Invader* fan, it's worth pointing out that it comes for a very sensible price — £2.99.

**Program** *Toccata*  
**Price** £2.99  
**Micro** BBC  
**Supplier** CompuSoft  
32 Watchyard Lane  
Formby  
Nr Liverpool  
L37 3JU

## BUSINESS

With the advent of the micro-drive, the idea that the Spectrum can be used as an effective business machine may gain more credence. If it does, then the software packages that are already available for the Spectrum will represent very good value for money.

A case in point is Kemp's *Sales Ledger* which, at least according to the blurb, does what a business package costing £150+ would do on a 'serious' machine.

The idea of the program is to provide a day-to-day record of outstanding accounts for the small business.

The program can find any record in two seconds. The eight menu options allow for five alterable VAT rates and a

print-out of all accounts and statements.

**Program** *Sales Ledger*  
**Price** £14.95  
**Micro** Spectrum 48K  
**Supplier** Kemp  
43 Muswell Hill  
London N10 3PN

## FULL COLOUR

Aficionados would say that *Mazogs* was one of the best five games on the ZX81.

Doubtless there are many people who have moved from the ZX81 to the Spectrum, but who still sneak back to its predecessor for a venture into the *Mazogs* maze. But, sadly, they may venture no more, because *Mazogs* is now available on the Spectrum.

The little man steps boldly into the maze, once more battling the dreaded *Maziacs* (more vicious relatives of *Mazogs*) and searching for the treasure at the heart of the maze — this time with full colour and sound.

**Program** *Maziacs*  
**Price** £6.95  
**Micro** Spectrum 48K  
**Supplier** DK Tronics  
Unit 2  
Shire Hill  
Industrial Estate  
Saffron Walden  
Essex CB11 3AX

## FIG-FORTH

So far as versions of Forth go, the Spectrum is well supplied with about half a dozen to choose from.

But, what of the Dragon? Here is a machine that could

certainly benefit from Forth's speed and flexibility (it might improve the quality of some of the software). Well, you may not have noticed, but there are four versions around.

One of the more visible (well, I've seen it) comes from M & J Software — initially a 32K cassette version with 64K disc and cassette versions to follow.

Unlike some of the Spectrum versions of Forth, there is a definite intention by the company to produce as close a version of fig forth as possible.

Although an extensive manual is included, it is stressed that this manual is not intended for beginners — more as a technical reference guide.

**Program** *Dragon fig-forth*  
**Price** £10 (cassette)  
**Micro** Dragon 32  
**Supplier** M & J Software  
34 Grays Close  
Scholar Green  
Stoke-on-Trent  
ST7 3JU

## PACKAGED

If you are a small business that owns a BBC, it's possible you would not batllk at the idea of paying £59.95 plus VAT for a series of business packages on disc — some versions for "big" computers cost three times that.

HCCS has various disc-based programs for *Invoicing*, *Payroll*, *Stock Control*, *Order Processing*, etc.

The *Integrated Invoicing* and *Sales Ledger* allows for printing and input of invoices, with calculation of discounts and VAT, maintenance of the sales ledger, cash allocation, printout of sales statement, invoice analysis, etc.

**Program** *Integrated Ledger*  
**Price** £59.95  
**Micro** BBC (Twin Disc)  
**Supplier** HCCS  
22 Market Square  
Biggleswade  
Beds SG18 8AS

New Releases is designed to let people know what software is coming on to the market. If you have a new game or utility which you are about to release send a copy and accompanying details to: New Releases, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

## Ziggurat

## More C

The function, *Function (x)*, was defined last week as:

```
FUNCTION(x)
  int x;
  if (x > 0) {
    p = p * x;
  }
  return(p);
}
```

and I asked you to think what it might mean. It is in fact the factorial function, and calculates the factorial of *x*.

The function is a *Function* with one parameter, *x*, and *x* is declared as an integer. If there are no arguments, there are no declarations.

Within the body of the function (ie, between { and }) a local variable *p* is declared as another integer. A local variable is not recognised outside the function. The variable is used in the loop which follows the declaration. Another way of writing the loop is:

```
p = 1;
while (x > 0) { p = p * x; --x; }
```

This says: let *p* equal to 1; while *x* is greater than zero, let *p* become equal to *p* times *x*, and decrement the value of *x* by 1. The factorial is calculated in variable *p*.

Another loop variant is:

```
p = 1;
do { p = p * x; --x; }
while (x > 0);
```

the difference being that the loop always executes once, even when *x* = 1. Even if *x* is initially zero, it still executes. After the loop has ended, the value of *p* is returned as the value of the function.

C has many nice little touches such as ++ or -- meaning increment or decrement by 1, ++*x* is the same as *x* = *x* + 1.

Like BCPL before it -c has many flexible control structures. The simple conditional is:

If (test) statement else statement 2

And there is a "switch" conditional which chooses from a series of alternatives (and includes a default if the alternative is not explicitly included). There is a further useful conditional:

*z* = (*x* < *y*) ? *x* : *y*;

which will place the lower of two values in the variable *z*.

There is a *Goto* statement in C, only operative within a function:

if (disaster) goto errorlabel;

Code involving a *Goto* can always be written without one, though perhaps at the price of some repeated tests or an extra variable.

Functions break large computing tasks into smaller ones, and enable collaboration between users. Appropriate functions can often hide details of operation from parts of the program that do not need to know about them.

In Fortran one is able to give new names to existing words. In C this is taken further. C has what is called "macro" substitution. That is, whenever a certain macro name is encountered in the program, the name is replaced by the exact supplied code.

```
#define min(x, y) ((x) < (y) ? (x) : (y))
```

When the line:

```
a = min (b, c)
```

is encountered, it will be replaced by the line:

```
a = ((b) < (c)) ? (b) : (c);
```

Just like that. The line will then be compiled normally: min (*x*, *y*) is not a call to a function, it is a straight substitution of code.

All sensible systems languages have powerful methods of using pointers, and the ability to concoct powerful methods of describing data. C is probably as powerful as Algol 68 in this respect.

The C Programming Language by Kernighan and Ritchie (mentioned last week) must be one of the very few books on programming languages which admits: "Like any other language, C has its blemishes. Some of the operators have the wrong precedence. Some parts of the syntax could be better. And there are several versions of the language extant, differing in minor ways."

I leave C with that honesty.

Boris Allan

## Puzzle

### Square's square

Puzzle No. 71

Can you find a number that is the sum of two squares in two different ways?

A few minutes spent with a calculator or table of squares will quickly reveal three such possibilities — all under 100.

$50 = 7^2 + 1^2$  or  $5^2 + 5^2$   
 $65 = 8^2 + 1^2$  or  $7^2 + 4^2$   
 $85 = 9^2 + 2^2$  or  $7^2 + 6^2$

Not quite so easy is the task of finding a number — the smallest possible — that is the sum of two squares in three different ways.

Can you solve it?

**Solution to Puzzle No 66**

In the program *W* is the number of wotzits. Line 30 eliminates impossible values of *N*. *PS* is the number of packages, and *D* is the number of wotzits per package.

```
10 LET N = 10
20 LET NS = STR$ N
30 IF N*(LEN NS) = "0" THEN GOTO 110
40 LET PS = ""
50 FOR M = 1 TO LEN NS
60 LET PS = NS(M) + PS
70 NEXT M
80 IF VAL PS = N THEN GOTO 110
90 LET D = N/VAL PS
100 IF D - INT D = 0 THEN PRINT N, D
110 LET N = N + 1
120 GOTO 20
```

This gives answers: 8712 wotzits in 2178 packages, each containing 4 wotzits. Although 9801 wotzits in 1089 packages of 9 wotzits is also a solution, it has the smallest number of packages of any solution, not the smallest total number of wotzits.

**Winner of Puzzle No 66**

The winner is: J J Wain, Dartington Avenue, Woodley, Reading, who receives £10.
